

Synergy Glowagg

Glow in the dark aggregate

Synergy GlowAgg is an inorganic, quartz like aggregate that absorbs light during the day and re-emits it when dark to give an amazing glow in the dark effect to your path or floor.

Available in Blue, Green or Aqua, GlowAgg appears quartz like during the day and can glow for up to 6 hours in ideal conditions. Aggregate size is approximately 8-15mm.

When used in pathways or polished concrete internal flooring GlowAgg is seeded on top of wet-laid concrete and troweled into the surface. This can then be exposed or polished to your requirements. For best results Synergy recommends using approximately 100-200 grams of GlowAgg per square metre.

Safety

Not only does Synergy GlowAgg look great but can also be used when the use of external lighting is unavailable and a safe guide is required.

Public walkways, mine sites and most external areas away from night street lighting can benefit from GlowAgg by guiding the way, increasing your safety onsite or for public safety.

Architects

Why not use GlowAgg in your next commission to add something different to your project. We can work with your concrete supplier to achieve an interesting and unique look.

**For aesthetics or safety
Synergy GlowAgg can brighten your way**

*Please note that Synergy GlowAgg works best in positions that receive direct light, yet are dark at night.

Different lighting conditions, such as street lighting, can affect brightness.
